Sample Solved Question and Detailed Step-by-Step Solution

To illustrate these principles, let's explore a typical IMT Quantitative Techniques problem.

Question:

A manufacturing company wants to analyze the daily production output. The data for the past 10 days is as follows: 120, 135, 150, 145, 160, 155, 140, 130, 165, 150. Calculate the mean, median, and mode of the production output. Also, interpret what these measures tell about the data.

Solution: Step-by-Step Explanation

Step 1: Organize Data

Day	Production Output
-----	-------------------

--	--

1	120
---	-----

2	135
---	-----

3	150
---	-----

4	145
---	-----

5	160
---	-----

6	155
---	-----

7	140
---	-----

| 8 | 130 |

| 9 | 165 |

| 10 | 150 |

Step 2: Calculate the Mean

- Formula: $\text{Mean} = \frac{\sum x_i}{n}$
- Sum of data: $120 + 135 + 150 + 145 + 160 + 155 + 140 + 130 + 165 + 150 = 1500$
- Number of observations: $n = 10$

[

$$\text{Mean} = \frac{1500}{10} = 150$$

]

Step 3: Find the Median

- Arrange data in ascending order:

120, 130, 135, 140, 145, 150, 150, 155, 160, 165

- Since $n = 10$ (even), median is the average of 5th and 6th values:

[

$$\text{Median} = \frac{145 + 150}{2} = \frac{295}{2} = 147.5$$

]

Step 4: Determine the Mode

- Frequencies:
- 150 appears twice
- Other values appear once

- Mode: 150 (most frequently occurring value)

Step 5: Interpretation of Results

- Mean (150): The average daily production over the 10 days is 150 units, indicating the typical output level.
- Median (147.5): Half the days had production below 147.5 units, and half above, suggesting a symmetric distribution around this value.
- Mode (150): The most common production figure, indicating a prevalent output level, possibly a production target or standard.

Conclusion:

The measures of central tendency suggest that the company's daily output is generally centered around 150 units, with a slight skew towards higher values due to the presence of higher production days.

Advanced Techniques and Application-Based Solutions

Beyond basic descriptive statistics, IMT assignments often involve advanced techniques such as probability calculations, regression analysis, and optimization models.

Example: Probability Calculation

Suppose the assignment asks to determine the probability that production exceeds 160 units based on historical data.

Approach:

- Count days with production > 160: only day 9 (165 units)
- Total days: 10
- Probability:

\[

$$P(\text{production} > 160) = \frac{1}{10} = 0.1$$

\]

Interpretation: There is a 10% chance on any given day that production exceeds 160 units, based on historical data.

Example: Regression Analysis

In a scenario where you have data on advertising expenditure and sales, you may be required to develop a regression model.

Basic steps:

- Plot data points to visualize relationships.
- Calculate the regression line parameters (slope and intercept).
- Use the regression equation to predict sales based on advertising spend.
- Analyze the strength and significance of the model.

Common Mistakes to Avoid in IMT Quantitative Techniques Assignments

To excel, students should be cautious of typical pitfalls:

- Misinterpreting data or question requirements
- Forgetting to check assumptions (e.g., normality)
- Skipping steps or presenting calculations without explanation
- Using incorrect formulas
- Rounding off prematurely or excessively
- Ignoring units or context in interpretation

Conclusion and Tips for Success
