## Understanding the Basics of Factoring Trinomials

### What Is a Trinomial?

A trinomial is a polynomial consisting of three terms. In the context of Algebra 1, the most common form of a quadratic trinomial is:

$$ax^2 + bx + c$$

where:

- **a**  $\neq 0$  (the coefficient of  $x^2$ )
- **b** is the coefficient of  $x$
- **c** is the constant term

### Why Factoring Trinomials Is Important

Factoring trinomials allows students to find the roots or solutions of quadratic equations, which are critical in solving real-world problems involving areas, motion, economics, and more. Additionally, factoring simplifies complex algebraic expressions, making further operations like division or substitution more manageable.

## Methods for Factoring Trinomials

## Factoring When Leading Coefficient (a) Is 1

The simplest scenario occurs when the coefficient of  $x^2$  is 1, i.e., the trinomial is in the form:

$$x^2 + bx + c$$

In this case, students can focus on finding two numbers that multiply to  $c$  and add to  $b$ . The steps are:

- Identify  $b$  and  $c$  in the trinomial.
- Find two numbers,  $m$  and  $n$ , such that:
  - $m \times n = c$
  - $m + n = b$
- Express the factored form as:  $(x + m)(x + n)$

For example, to factor  $x^2 + 5x + 6$ :

- Find  $m$  and  $n$  such that  $m \times n = 6$  and  $m + n = 5$ .
- $m = 2$ ,  $n = 3$ .
- Factored form:  $(x + 2)(x + 3)$ .

## Factoring When Leading Coefficient (a) Is Not 1

This scenario is more complex and involves additional steps. The general form is:

$$ax^2 + bx + c$$

Methods include:

- Trial and error with factoring
- AC method (also called the grouping method)
- Decomposition method

## The AC Method Explained

- Multiply the coefficient of  $x^2$  ( $a$ ) by the constant term ( $c$ ):  $ac = a \times c$
- Find two numbers,  $m$  and  $n$ , such that:
  - $m \times n = ac$

- $m + n = b$
- Rewrite the middle term  $bx$  as two terms using  $m$  and  $n$ :  $ax^2 + mx + nx + c$
- Factor by grouping:
  - Group the first two terms and the last two terms:  
 $(ax^2 + mx) + (nx + c)$
  - Factor out the common factors from each group:
    - From the first group:  $x(ax + m)$
    - From the second group:  $(nx + c)$
- Express the entire expression as a product of binomials.
